

Software Developer (FDE)

Forward Deployed Engineer

Assignment

Problem Statement

Build a chat like interface for a Journal app using Vercel Generative UI SDK

User Journeys

1. User should be able to add a new Log in the Journal by writing a prompt like "Remind me to buy eggs next time I'm at the supermarket" or "Alice says 'I should check out Kritunga for their awesome biryani'"
2. The user can query their journal asking "What is my shopping list" or "I'm at the supermarket. What should I buy?" - both of these should return the entries in their shopping list

Implementation details

1. Please use the SDK mentioned above. It requires a basic understanding of LLMs, Function Calling & React SSR
2. You'll need access to a model to complete the implementation. We can provide you with an OpenAPI key if required.
3. There are no requirements with respect to the stylistic elements of the assignment but feel free to use any open source react component library if you so wish.
4. Creating a backend API for this is not required. Use server memory for any persistence requirements.
5. BONUS: Think about safeguarding against model hallucinations & keeping the chat only limited to interactions within a journaling app. For example, if the user inputs "What is 2+2" the ideal response would be "I'm only a journaling app. I can't do mathematical calculations"

PS: If you are more comfortable with Python you can implement the same using streamlit instead of Vercel SDK

Restrictions

You can assume that the entire chat history fits into memory but you shouldn't assume the entire chat history fits into a single prompt

Feel free to ask for clarifications & any more details that might be required.

Deliverables

- Code and Readme
